

Dr. Albanese's research interests are in forensic anthropology and bioarchaeology. He uses a biocultural approach to investigate human skeletal variation, the history of anatomical instruction and physical anthropology, and race and racism in anthropology and forensic science. He has developed new theoretical and methodological approaches for investigating human variation using identified skeletal collections in North America and Europe including the Terry, Grant, Coimbra, and Lisbon Collections. He has applied these new methodologies to develop skeletal sex estimation methods and stature estimation methods that are widely applicable in forensic cases and bioarchaeological contexts, and he has extensively critiqued the "race concept" in forensic anthropology. He has recently begun a comprehensive investigation of human and animal skeletons from Mycenaean Greece. He has worked with First Nations in Ontario on repatriation issues. He regularly assists the Windsor Police Service and is involved in the investigation of international human rights violations. Dr Albanese is a member of the "Feminism, Social Justice & Argumentation" and "Scientific Argumentation" research clusters of the Argumentation Studies Ph.D. program.
